Statistical Inference...

Statistical inference is the <u>process</u> of making an estimate, <u>prediction</u>, or decision about a <u>population</u> based on a sample.

Population

 Inferential statistics is used to draw conclusions or inferences about characteristics of *populations* based on data from a *sample*.

Statistical Estimation

Point Estimation vs. Interval Estimation

- ❖Statisticians use sample <u>statistics</u> to estimate population <u>p</u> arameters.
- For example, sample means are used to estimate population means; sample proportions, to estimate population proportions.

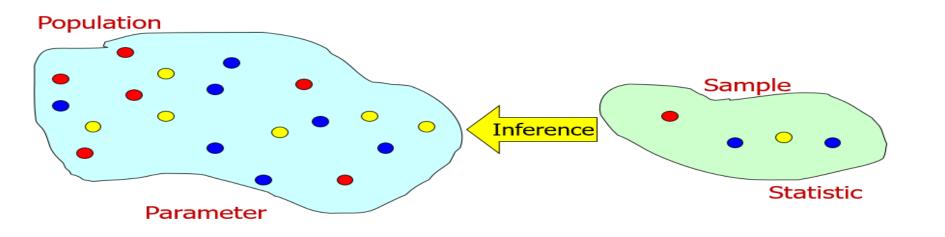

- An estimate of a population parameter may be expressed in two ways:
 - ✓ Point Estimation
 - ✓ Interval Estimation

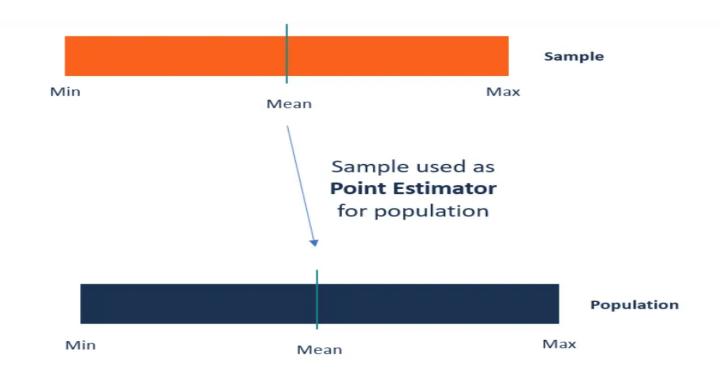

Point Estimation

*A point estimate of a population parameter is a single value of a statistic.

*For example, the sample meanx is a point estimate of the population mean and sample variance is a point estimate of estimation of the population?

Similarly, the sample proportion p is a point estimate of the population proportion P.

What are confidence intervals and why do we need them?

- Confidence intervals are calculated from an estimate of how far away our sample mean is from the actual population mean; the amount of error (or discrepancy) from our sample mean to the population mean.
- Confidence intervals provide us with an upper and lower limit around our sample mean, and within this interval we can then be confident we have captured the population mean.
- The <u>lower limit and upper limit around our sample mean</u> tells us the <u>range of values our true population mean</u> is likely to lie within.

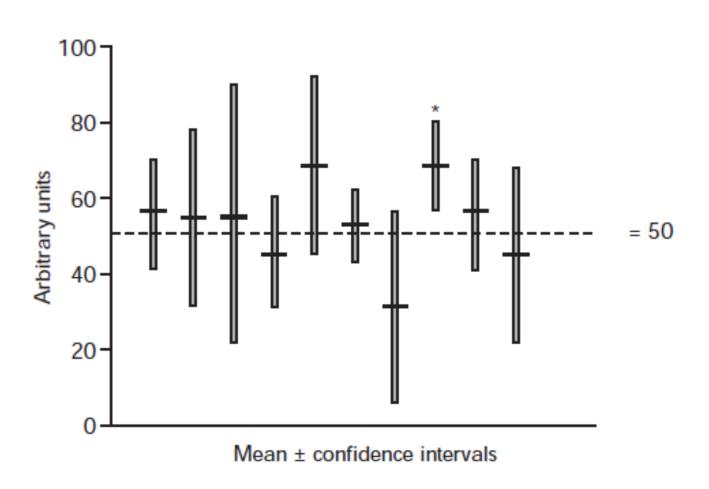

Interval Estimation

An interval estimate is defined by two numbers, between which a population parameter is said to lie.

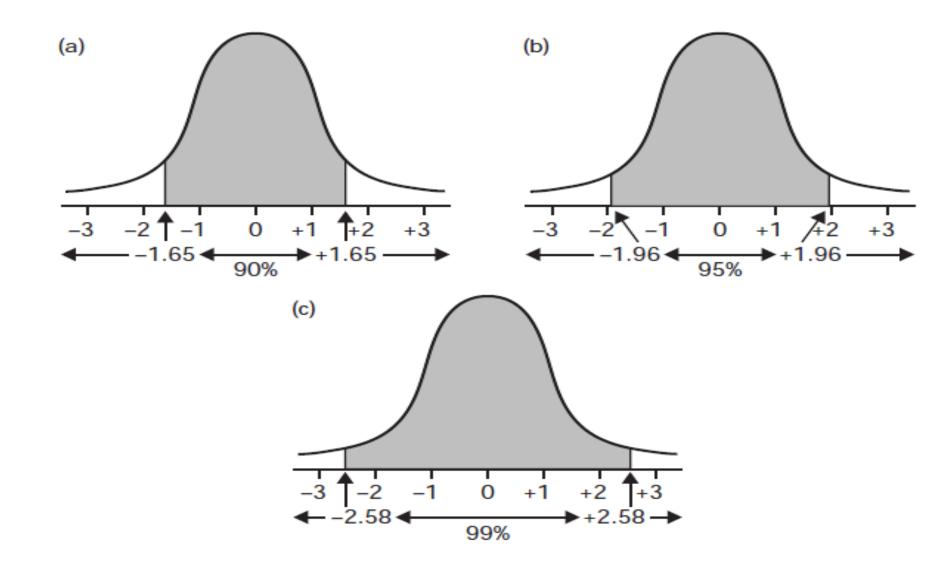

For example, $a \times < b$ is an interval estimate of the population mean μ .

It indicates that the population mean is greater than a but less than b.

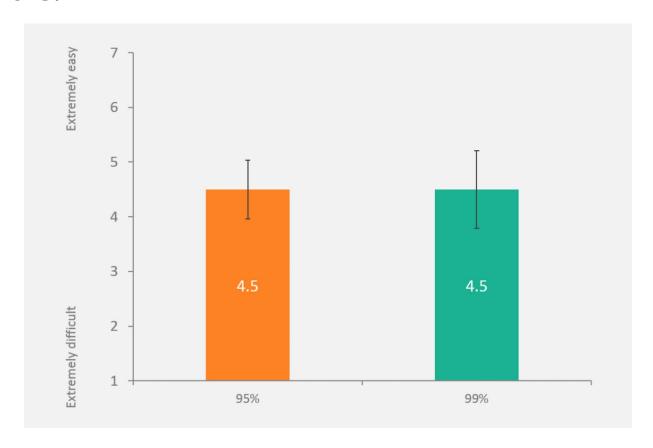

Mean and 90% confidence intervals derived from 10 samples

Probability functions within the standardized normal distribution.

 The 99% confidence interval has longer arms, in order to be more confident we have captured the population mean so we need to increase the width of our confidence intervals.

Estimating the Confidence Intervals for Sample Mean

This part describes how to construct a <u>confidence interval</u> for a sample mean,

Estimation Requirements

The approach is valid whenever the following conditions are met:

1. The sampling method is <u>simple random sampling</u>.

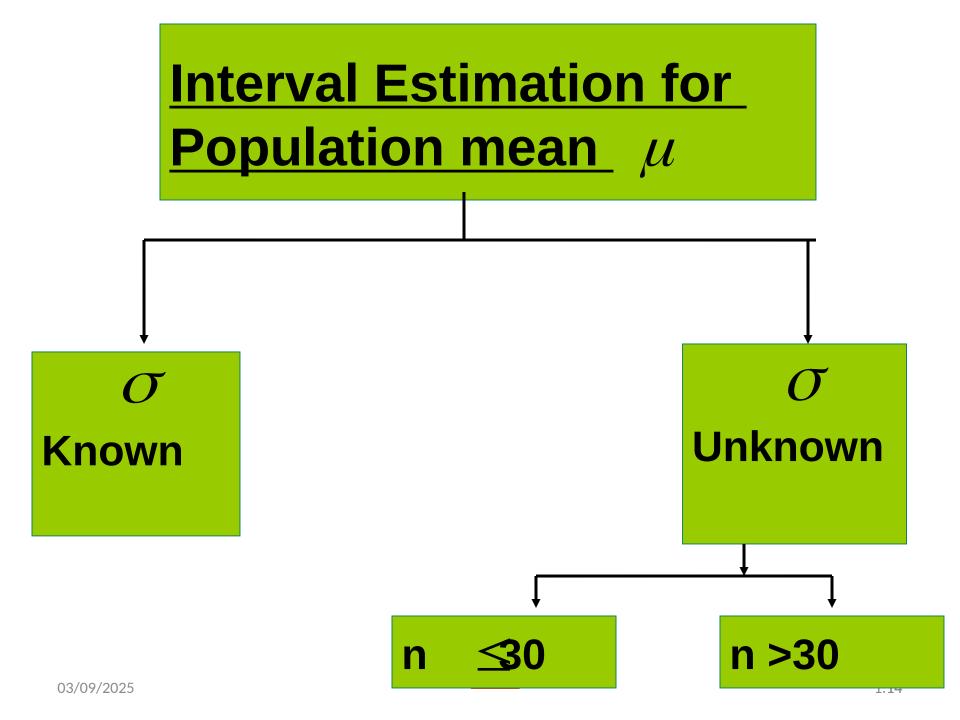

2. The <u>sampling distribution</u> is approximately normally distributed.

Generally, the <u>sampling distribution will be approximately</u> <u>normally distributed</u> if any of the following conditions apply.

✓ The population distribution is normal.

✓ The sampling distribution is <u>symmetric</u>, <u>unimodal</u>,
without <u>outliers</u>, and the sample size is 30 or less.

✓ The sample size is greater than 30, without outliers.

Interval Estimation for population mean when is known-Estimation Requirements

The approach described in this lesson is valid whenever the following conditions are met:

1. The sampling method is <u>simple random sampling</u>.

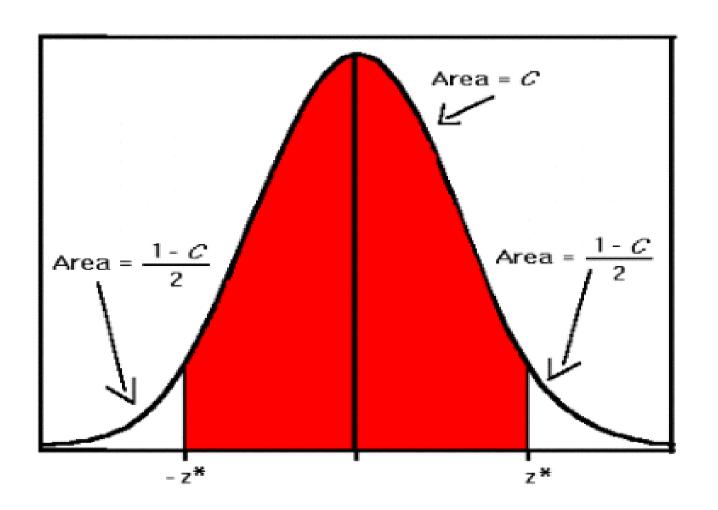

2. The <u>sampling distribution</u> is approximately normally distributed.

3. Generally, the sampling distribution will be approximately normally distributed when the sample size is greater than or equal to 30.

Interval Estimation for population mean μ when σ^2 is known

Let X_1, X_2, \dots, X_n be a random sample of size n from a normal distribution with mean μ and variance σ^2 .

$$x \sim N(\mu, \sigma^2)$$

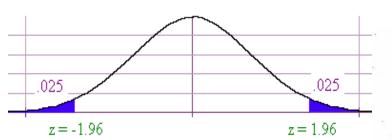

$$\frac{-}{x} \pm z_{\alpha/2} \frac{\sigma}{\sqrt{n}}$$

Example (01)

According to a random sample of 30 students of a certain institute, the average reading speed of the students is 80 words per minute with a population stranded deviation 6.8 words per minute.

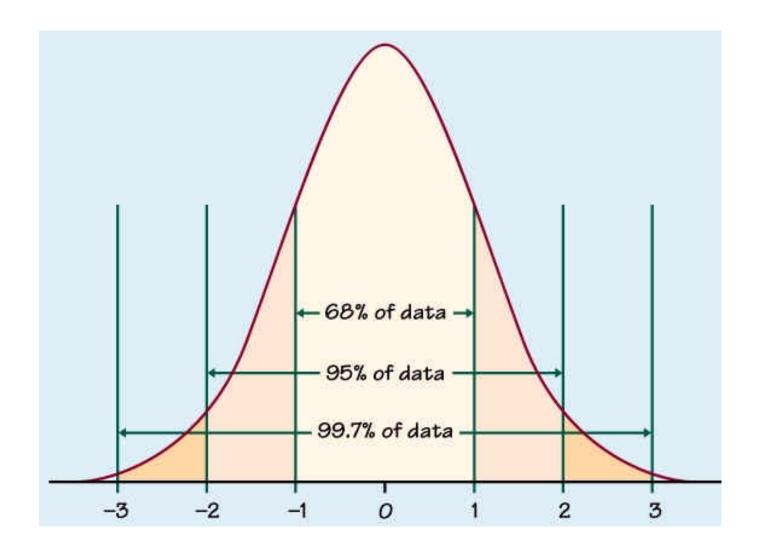

Constrict 68%, 95% and 99% confidence interval for the mean reading speed of a student of the institute.

CUMULATIVE NORMAL DISTRIBUTION

$$\Phi(x) = \int_{-\pi}^{x} \frac{1}{\sqrt{2\pi}} e^{-t^{2}/2} dt$$

Example (02)

Due to the decrease in interest rate, the Bank of Ceylon received a lot of mortgage applications. A recent sample of <u>25</u> mortgage loans resulted in <u>an average of \$257,300</u>. Assume a population standard deviation of \$25,000.

If the next customer called in for a mortgage loan application, find a 95% prediction interval on this customer's loan amount.

Example (03)

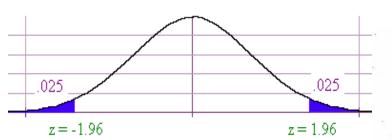

The fertilizer mixing machine is set to add Nitrite for every bag of fertilizer. Randomly selected 16 bags are examined. The percentages of Nitrate of the bags are as below.

```
21.8 21.6 21.0 20.9 19.8 19.6 20.9 21.1 20.4 20.6 19.7 19.6 20.3 23.7 20.5 20.8
```

It is given that the population standard deviation of the distribution is 0.48.

Find the 95% confidence interval for the true mean percentage of Nitrate of the distribution.

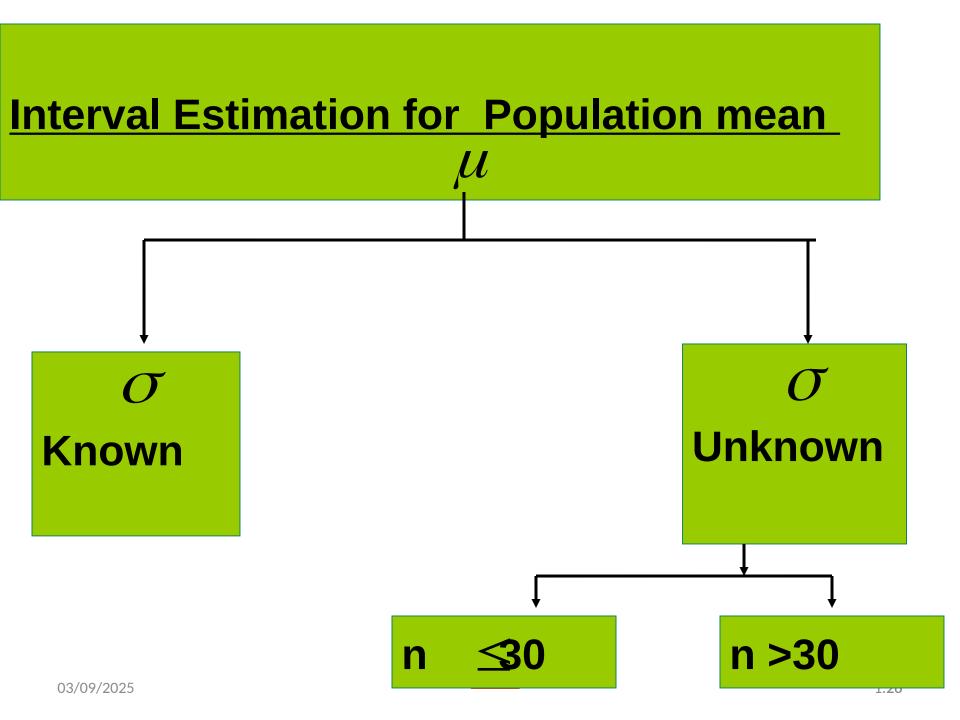

We are 95% confident that the population of all bags between---- and

Interval Estimation for Population mean when is unknown and n 30_

- Frequently, we are attempting to estimate the mean of a population when the variance is unknown.
- If we have a random sample from a normal distribution, then the random variable *T*,

• $T = \frac{\bar{X} - \mu}{S/\sqrt{n}}$ has a Student t-distribution with n-1 degrees of freedom.

Interval Estimation for Population mean when is unknown and n 30

Let X_1, X_2, \ldots, X_n be a random sample of size n from a normal distribution with mean μ and variance σ^2 .

$$x \sim N(\mu, \sigma^2)$$

Then,

$$P(-t_{\alpha/2} < T < t_{\alpha/2}) = 1 - \alpha$$

$$P\left(-t_{\alpha/2} < \frac{\bar{X} - \mu}{S/\sqrt{n}} < t_{\alpha/2}\right) = 1 - \alpha$$

• Then $100(1-\alpha)\%$ confidence interval for μ is,

$$(\bar{x} - t_{\alpha/2} \frac{s}{\sqrt{n}} < \mu < \bar{x} + t_{\alpha/2} \frac{s}{\sqrt{n}})$$

Where $t_{\alpha/2}$ is the t-value with $\nu=n-1$ degrees of freedom.

$$\frac{-}{x \pm t_{(\alpha/2,n-1)}} \frac{S}{\sqrt{n}}$$

Example (04)

Let X be the weight in grams of a 52 gram snack pack of candies. Assume that X, is normally distributed variance 4. The weights of 10 snack packs are;

55.54	56.54	57.58	55.13	57.48
56.06	59.93	58.30	52.57	58.46

Find a 95% confidence interval for the mean percentage of candies.

We are 95% confident that the population of all candies bags mean is between---- and

Example (05)

A machine is producing metal pieces that are cylindrical in shape. A sample of pieces is taken and diameters are in centimeters as follows,

1.01 0.97 1.03 1.04 0.99

0.98 0.99 1.01 and 1.03

Assuming the data is normal distributed. Find a 99% confidence interval for the mean diameter.

Interval Estimation for Population mean μ when σ is unknown and n > 30

Let X_1, X_2, \ldots, X_n be a random sample of size n from a normal distribution with mean μ and variance σ^2 . $x \sim N(\mu, \sigma^2)$

$$t_{(\alpha/2,n-1)} \approx Z_{\alpha/2}$$

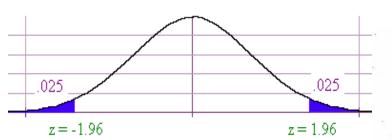

$$-\frac{1}{x \pm Z_{\alpha/2}} S \sqrt{\frac{1}{n}}$$

Example (08)

The fertilizer mixing machine is set to add Nitrite for every bag of fertilizer. Randomly selected 36 bags are examined. The percentages of Nitrate of the bags are as below.

	21.8	21.6	21.0	20.9
19.8	19.6	20.9	21.1	
	20.4	20.6	19.7	19.6
20.3	23.7	20.5	20.8	
	20.5	26.3	24.5	25.6
30.2	25.6	40.2	33.2	
24.6	28.4	21.5	33.2	30.5
29.8	25.6	24.9		36.2
26.5	30.5	24.0		

Find the 95% confidence interval for the true mean true mean percentage of Nitrate of the distribution

CUMULATIVE NORMAL DISTRIBUTION

$$\Phi(x) = \int_{-\infty}^{x} \frac{1}{\sqrt{2\pi}} e^{-t^2/2} dt$$

Example (09)

A manufacturer of synthetic fiber wished to estimate the mean braking strength of the materials and 35 fiber were selected at random and breaking strengths were found to be,

20.8	20.6	21.0	19.8	19.6	20.9	
21.2	21.4	20.6	19.7	20.7	20.5	23.8
22.2	25.6	24.6	26.5	28.7	29.2	2 <mark>5.8</mark>
24.7	26.5	28.9	29.3	24.5		

Find the 99% confidence interval for the true mean breaking strength.
